

Webinar Feature — Developer Documentation

For: Web developer/agency building or updating cyvant.org **Related documents:** CYVANT Website PRD (Section 3.5 Webinars, Section 5 Forms, Section 7 Database/CRM Architecture), CYVANT Webinar SOP (CYVANT-OPS-SOP-001) **Purpose:** This document gives the technical detail needed to actually build the Webinars feature — data model, page states, sync behavior, and integration points — beyond what's covered at a content level in the main PRD.

1. Where This Feature Lives

Two surfaces, one data source:

Home page banner — shows the current upcoming webinar (title, date, register CTA)

Webinars page — full page with the upcoming webinar featured at the top, plus a past webinars archive below

Critical requirement: both surfaces must pull from the same underlying data record. Do not implement these as two separately managed pieces of content — if the webinar date changes or a new one is scheduled, updating it once should update both surfaces automatically.

2. Data Model

Suggested schema for a `Webinar` object/record:

```

Webinar {
  id: string (unique)
  slug: string (URL-friendly, e.g. "career-pivot-aug-2026")
  title: string // e.g. "Career Pivot"
  subtitle: string // e.g. "Breaking Into Cyber/AI With No Tech Background"
  date: date
  time: string // include timezone, e.g. "6:00 PM WAT"
  status: enum [upcoming, live, past]
  description: rich text // short summary for cards/banners
  format_summary: string // e.g. "Student presentation, 2 speakers, panel, audience Q&A"
  speakers: [
    {
      name: string
      role: enum [Founder, Guest Speaker, Student Presenter]
      bio: text
      photo_url: image
    }
  ]
  registration_open: boolean
  registration_form_id: reference // links to the embedded registration form (see Section 5 of PRD)
  thumbnail_image: image
  recording_url: string | null
  recording_permission_confirmed: boolean // must be true before recording_url is ever displayed publicly
  recap_content: rich text | null
  key_clips: [url] // optional short clips for the archive entry
}

```

Status logic (auto-computed, not manually set where possible):

`upcoming` = `date >= today` — this record shows on both the Home banner and the top of the Webinars page

`past` = `date < today` — this record moves automatically into the archive section

Only one `upcoming` webinar should be featured at a time; if multiple exist, feature the soonest by date

3. Page States & Behavior

Home Page Banner

Query: the single soonest-dated webinar where `status = upcoming`

Displays: title, subtitle, date, register CTA (linking to the embedded form)

If no upcoming webinar exists: hide the banner entirely, or show a lightweight “Webinars coming soon — join our list” state with an email capture — do not leave a broken/empty-looking banner

Webinars Page — Upcoming Section (top of page)

Same underlying record as the Home banner

Fuller detail: full description, format summary, all speaker bios/photos, embedded registration form directly on the page (not a redirect)

If no upcoming webinar exists: show the same "Stay tuned" fallback state described above

Webinars Page — Past Webinars Archive

Query: all webinars where `[status = past]`, sorted by date descending

Each entry displays: thumbnail, title, date, short recap

Recording playback/link only displays if `[recording_permission_confirmed = true]` — this must be enforced at the query/display level, not just a content convention, so a recording can never accidentally go live before permission is confirmed

Recap content and key clips can display independently of the recording permission flag, since those are typically pre-approved for publishing per the Post-Event Workflow

4. Registration Form Behavior

Applies to both the Home banner CTA and the Webinars page embedded form — same form, same destination, per PRD Section 5:

Fields: Name, Email, Phone/WhatsApp, one qualifying question (content varies per webinar — should be configurable per `[Webinar]` record, not hardcoded)

Validation: inline, required fields, valid email format before submission

On successful submission: show a confirmation message on-page (no dead-end state) and fire a confirmation email to the submitter

Data destination: every submission creates/updates a record in the CRM (see PRD Section 7), tagged with: Source: "Webinar Registration"

The specific webinar's `[id]/[slug]` (so registrations are tracked per-event, not just generically)

No external redirect — this form must be embedded on-site, not a Zoho/Google Form link out

5. Content Management Requirements

The Digital Marketer needs to be able to add, edit, and archive webinar entries **without developer involvement** for each monthly cycle. This means:

A simple admin interface or CMS-backed entry form covering all fields in the Section 2 data model

Adding a new `[Webinar]` record and setting it live should be a non-technical, self-service action

Marking a webinar's `[recording_permission_confirmed]` flag should be an explicit, deliberate action in the admin UI — not a default-on toggle — to prevent accidental publishing

Recommend whichever CMS/admin approach the developer proposes (headless CMS, simple database-backed admin panel, etc.) — the specific tool is flexible, but the non-technical, self-service requirement is not.

6. Branding Requirements

Per the Webinar SOP's Branding Standards, any webinar-related page assets (banners, speaker cards, thumbnails) must use: CYVANT logo, consistent brand colors, matching typography, professional/consistent design — same visual system as the rest of the site, not a one-off style for this section.

7. Acceptance Criteria

Before this feature is considered complete:

- ☐ Home banner and Webinars page pull from the same single source record — no duplicate/manual entry
- ☐ Upcoming webinar auto-transitions to the past archive based on date, without manual status changes
- ☐ "Stay tuned" fallback state displays correctly when no upcoming webinar exists
- ☐ Registration form is embedded on-site (both banner CTA and Webinars page), not an external redirect
- ☐ Every registration creates a CRM record tagged with the specific webinar
- ☐ Recording links/playback are hidden unless `recording_permission_confirmed = true`
- ☐ Digital Marketer can add/edit/archive a webinar entry without developer support
- ☐ Qualifying question field is configurable per webinar, not hardcoded site-wide
